

# Firewall as a service

Giving you a level of visibility and control over your applications that a traditional network firewall can't match.

## about the service

To keep your organisation protected, you need to ensure your security solutions can cope with modern cyberattacks. Firewalls are an essential security measure for any organisation's cyber security infrastructure as they ultimately filter all traffic that tries to cross the network's border for inspection and can administer the network boundary where necessary preventing cyber-attacks. Firewall as a Service (FWaaS) takes the capabilities of a Next-Generation Firewall (NGFW) and shifts it from a physical application to the Cloud. By removing the security capabilities from the physical infrastructure of a business allows any business a securer connection to remote working and therefore can cope with the modern corporate network having applications on-premises and in the cloud.

## how it works

Our Firewall as a Service (FWaaS) utilises next-generation firewalls to add an extra layer of security to your IT infrastructure by giving you a level of visibility and control over your applications that traditional network firewalls cannot match. We will provide you with a fully managed unified threat management next-generation firewall to protect your network. We can use this to analyse and signature match identifying threats to your business so that we can help you prevent any potential attacks.

Our next-generation firewalls are delivered to you as a part of your Cloud Infrastructure as they go beyond the capabilities of your traditional network firewalls.

## key benefits

### Faster performance

We use high speed multi-core hardware architecture to allow us to give you faster performance than your standard firewalls.

### Protection

Our FWaaS gives you the added tier of protection from threats and attacks that your traditional existing firewalls won't be able to.

### Flexible

We offer you support in finding the correct firewall solution for your business as we know that one size doesn't fit all whether you're a enterprise or a small business.

### Specialised

Our expert teams will only use specialised industry-leading next-generation firewall software to help your organisation block more attacks and keep you protected.

## features

### Centralised Management

Our FWaaS offers you a centralised platform for managing firewall policies across distributed networks and multiple locations, simplifying administration and ensuring consistent security posture organisation-wide.

### Scalability and Flexibility

With our FWaaS, you can easily scale firewall capacity and features to adapt to changing network requirements, whether it's accommodating increased traffic volumes, adding new applications, or expanding to new locations.

### Advanced Threat Protection

Our FWaaS solution comes equipped with advanced security features such as intrusion detection and prevention, application control, malware detection, and content filtering to effectively mitigate a wide range of cyber threats and protect against emerging vulnerabilities.

### Performance Optimisation

Our team of experts optimise your network traffic and enhance performance through intelligent traffic routing, and bandwidth management techniques, ensuring critical applications receive priority access to resources and maintain optimal network performance.

### Real-Time Monitoring and Reporting

We will provide real-time monitoring and reporting capabilities, allowing you to track firewall performance, analyse network traffic patterns, and identify security incidents as they occur.

### Automatic Updates and Maintenance:

Our FWaaS solutions are regularly updated and maintained, ensuring that your firewalls are equipped with the latest security patches, firmware updates, and threat intelligence feeds, helping you to stay ahead and maintain continuous protection against evolving cyber threats.

## why you need it

- You want to improve your organisation's network security.
- You want to ensure you have the best firewall software available to prevent threats.
- You are looking for an expert team to manage your organisation's firewall safety and advise on how you can improve and remove any potential areas of weakness.
- You want to alleviate your IT team from managing and monitoring the organisation's firewall safety so that they can focus on strategic tasks.

## other useful services

### SaaS protection Services

Providing an advanced, independent, all-in-one back up, restore and export solution to avoid common data loss pitfalls.

### Penetration Testing Services

Taking a deep dive into your systems to uncover issues, vulnerabilities & test your security's effectiveness against cyber-attacks.

### Extended Detection Response (XDR) Services

Faster, deeper, more effective threat detection response offering proactive approaches to shield against new threats.
